Dokerized Construction Services

Course Name: DevOps

Institution Name: Medi-caps University – Datagami Skill Based Course

Student Name(s) & Enrolment Number(s):

Sr no	Student Name	Enrolment Number
01	Ansh Kumbhare	EN22CS301140
02	Anshul Sen	EN22CS301158
03	Anshul Yadav	EN22CS301159
04	Armi Bhawsar	EN22CS301194
05	Atharv Dubey	EN22CS301229

Group Name: 06D2

Project Number: DO-18

Industry Mentor Name: Mr. Vaibhav

University Mentor Name: Prof. Akshay Saxena

Academic Year: 2025-26

Problem Statement & Objectives

1. Problem Statement

Modern construction service applications face significant challenges in deployment and scalability. Traditional deployment methods often result in:

- Inconsistent environments across development and production
- Dependency conflicts and configuration issues
- Time-consuming manual setup processes
- Difficulty in scaling applications for large projects

These issues reduce productivity and increase the chances of system failures. Therefore, a containerized solution is required to ensure consistent, scalable, and efficient deployment of construction services

2. Project Objectives

The main objectives of the Dockerized Construction Service are:

- To containerize the construction service using Docker
- To ensure consistency across development, testing, and production environments
- To optimize application performance using multi-stage Docker builds
- To automate build and deployment processes using CI/CD pipelines
- To enable scalability and high availability using container orchestration

3. Scope of the Project

The project focuses on:

- Containerizing the construction service application
- Managing multi-container environments using Docker Compose
- Automating deployment through CI/CD pipelines
- Supporting scalable deployments using Kubernetes
- Ensuring portability across different systems and platforms.

Limitations:

- Requires understanding of Docker and DevOps concepts
- Initial setup complexity for beginners
- Kubernetes deployment may require cloud infrastructure
- Debugging containerized applications can be challenging.

4. Proposed Solution

The proposed system is a Docker-based containerized construction service that ensures efficient deployment and scalability.

The solution includes:

- Creating optimized multi-stage Dockerfiles to reduce image size and improve security
- Using Docker Compose to manage application and database services
- Implementing CI/CD pipelines using GitHub Actions for automation
- Deploying containers using Kubernetes for scalability and fault tolerance

This approach ensures a reliable, consistent, and production-ready system.

A. Key features

- Multi-stage Docker builds for optimized performance
- Container orchestration using Docker Compose
- Automated CI/CD pipeline integration
- Scalable deployment using Kubernetes
- Improved security and reduced image size
- Faster and consistent application deployment

B. Overall Architecture / Workflow

The system follows a structured DevOps workflow:

1. Developer writes code and pushes it to GitHub
2. CI/CD pipeline is triggered automatically
3. Docker image is built using a multi-stage Dockerfile
4. Image is stored in a container registry
5. Docker Compose or Kubernetes deploys the application
6. Users access the application through deployed services

C. Tools & Technologies Used

- Programming Language: Python
- Containerization: Docker
- CI/CD Tools: GitHub Actions
- Orchestration: Kubernetes
- Version Control: Git & GitHub

Results & Output

1. Screenshots / outputs

The project successfully demonstrates:

- Faster and automated deployment process
- Consistent environment across all stages
- Reduced manual configuration errors
- Improved scalability and system reliability

Construction Site Report
Project Name: Lakeview Hospital Extension is a healthcare facility expansion project located in Ko
Date: 21 April 2026
SITE REPORT
1. Project Overview
* Project Name: Lakeview Hospital Extension
* Project Type: Healthcare facility expansion project
* Location: Kochi, Kerala
* Date of Observation: 14 February 2026
2. Work Executed
Internal plastering work was in progress using cement and sand mortar. Proper surface preparation was carried out prior to plaster application. Electrical conduit openings were maintained within plastered walls. Wooden scaffolding was used for internal access.
3. Manpower & Machinery
* Manpower: Eight skilled plasterers and six helpers were engaged.
* Machinery: No heavy machinery was involved.
4. Safety Observations
Helmet usage among workers was confirmed. No safety incidents were reported.
5. Issues & Remarks
No delays were reported.

2. Key outcomes

- Deployment time reduced significantly
- Increased development efficiency
- Improved system stability
- Better collaboration among team members

Conclusion

The Dockerized Construction Service project demonstrates how modern DevOps practices can transform application deployment.

The system:

- Eliminates environment inconsistencies
- Automates deployment workflows
- Enhances scalability and reliability

This project highlights the importance of containerization and automation in real-world software systems and provides practical experience in Docker, CI/CD, and orchestration tools.

Future Scope & Enhancements

- Deployment on cloud platforms (AWS, Azure, GCP)
- Integration with monitoring tools like Prometheus and Grafana
- Advanced security scanning for Docker images
- Implementation of auto-scaling policies in Kubernetes
- Integration with real-time construction management systems
